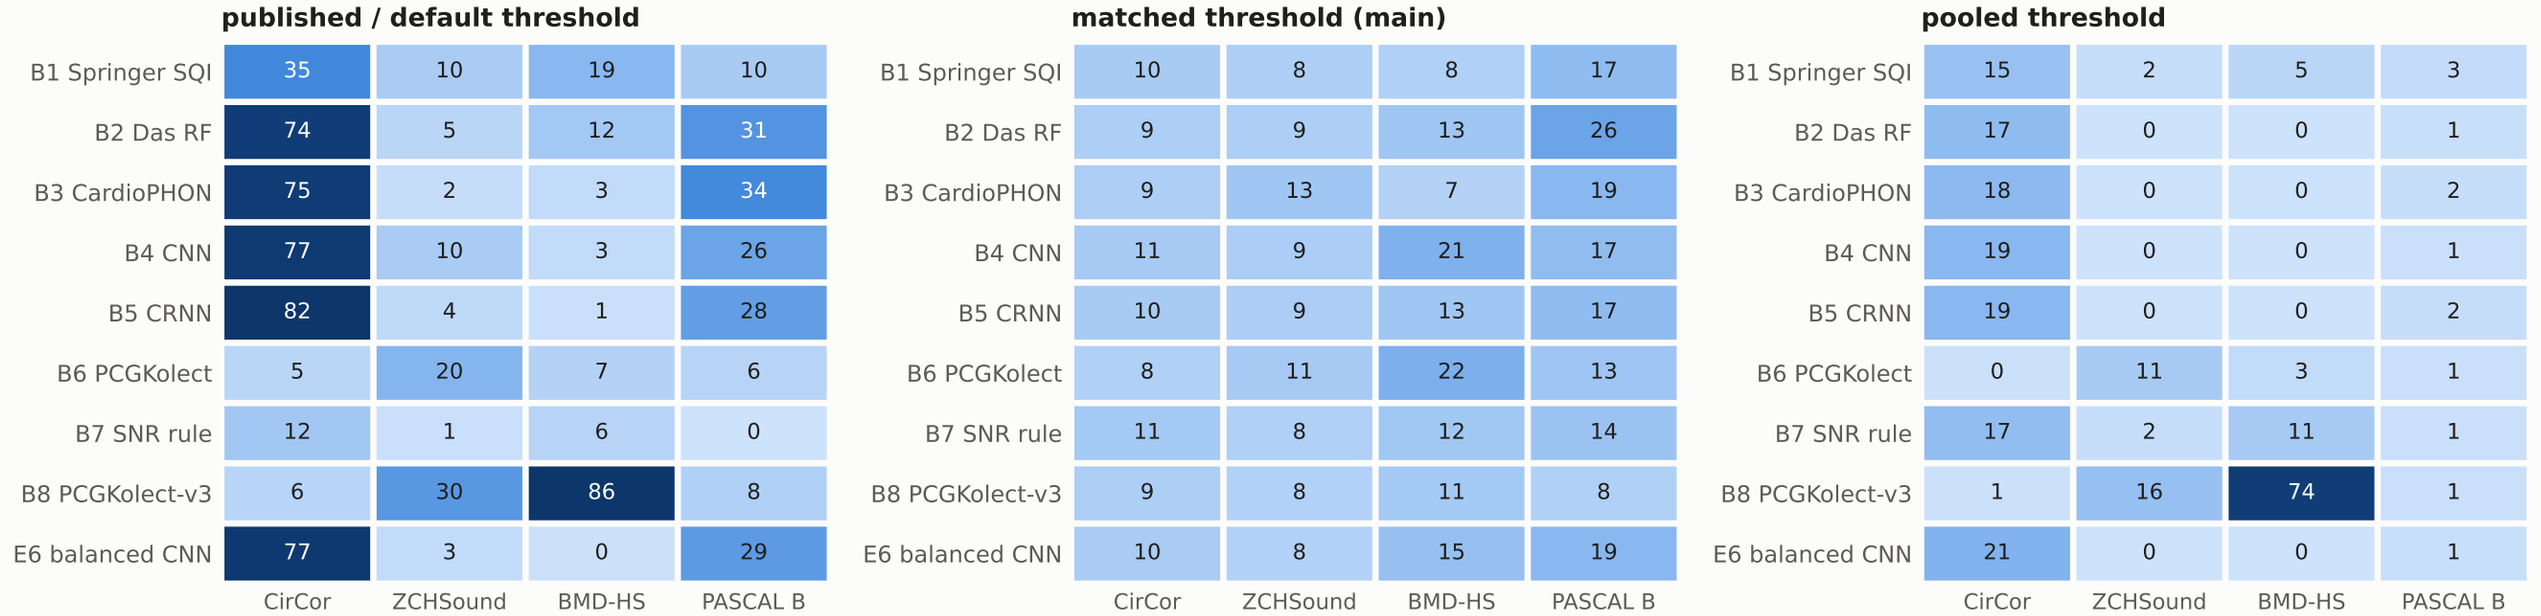
Clean NORMAL evaluation beats rejected (%) — target 10 %



Published thresholds do not transfer (CirCor: 73-82 % of clean normal beats rejected by B2-B5). Matched thresholds hit 10 % on calibration patients; evaluation rates deviate where calibration sets are small (BMD-HS 4, PASCAL 18 normal patients). Pooled thresholds are dominated by the domain-shifted sets. B1 SVM omitted (excluded on CirCor).
