GEE odds ratios with 95 % CI (E2, all noise levels, pooled over 3 seeds): grey = unadjusted, black = adjusted; red/blue = seed-robust significant after adjustment

rejected ~ class + SNR level [+ HR + HR² + age category] (+ seed for seeded models), exchangeable correlation, patient clusters; Holm across the 11-model family (each hybrid added on its own). Seed-robust = Holm-significant in ≥ 2 of 3 seeds and pooled. OR > 1: pathology rejected more often. BMD-HS age not identifiable.
