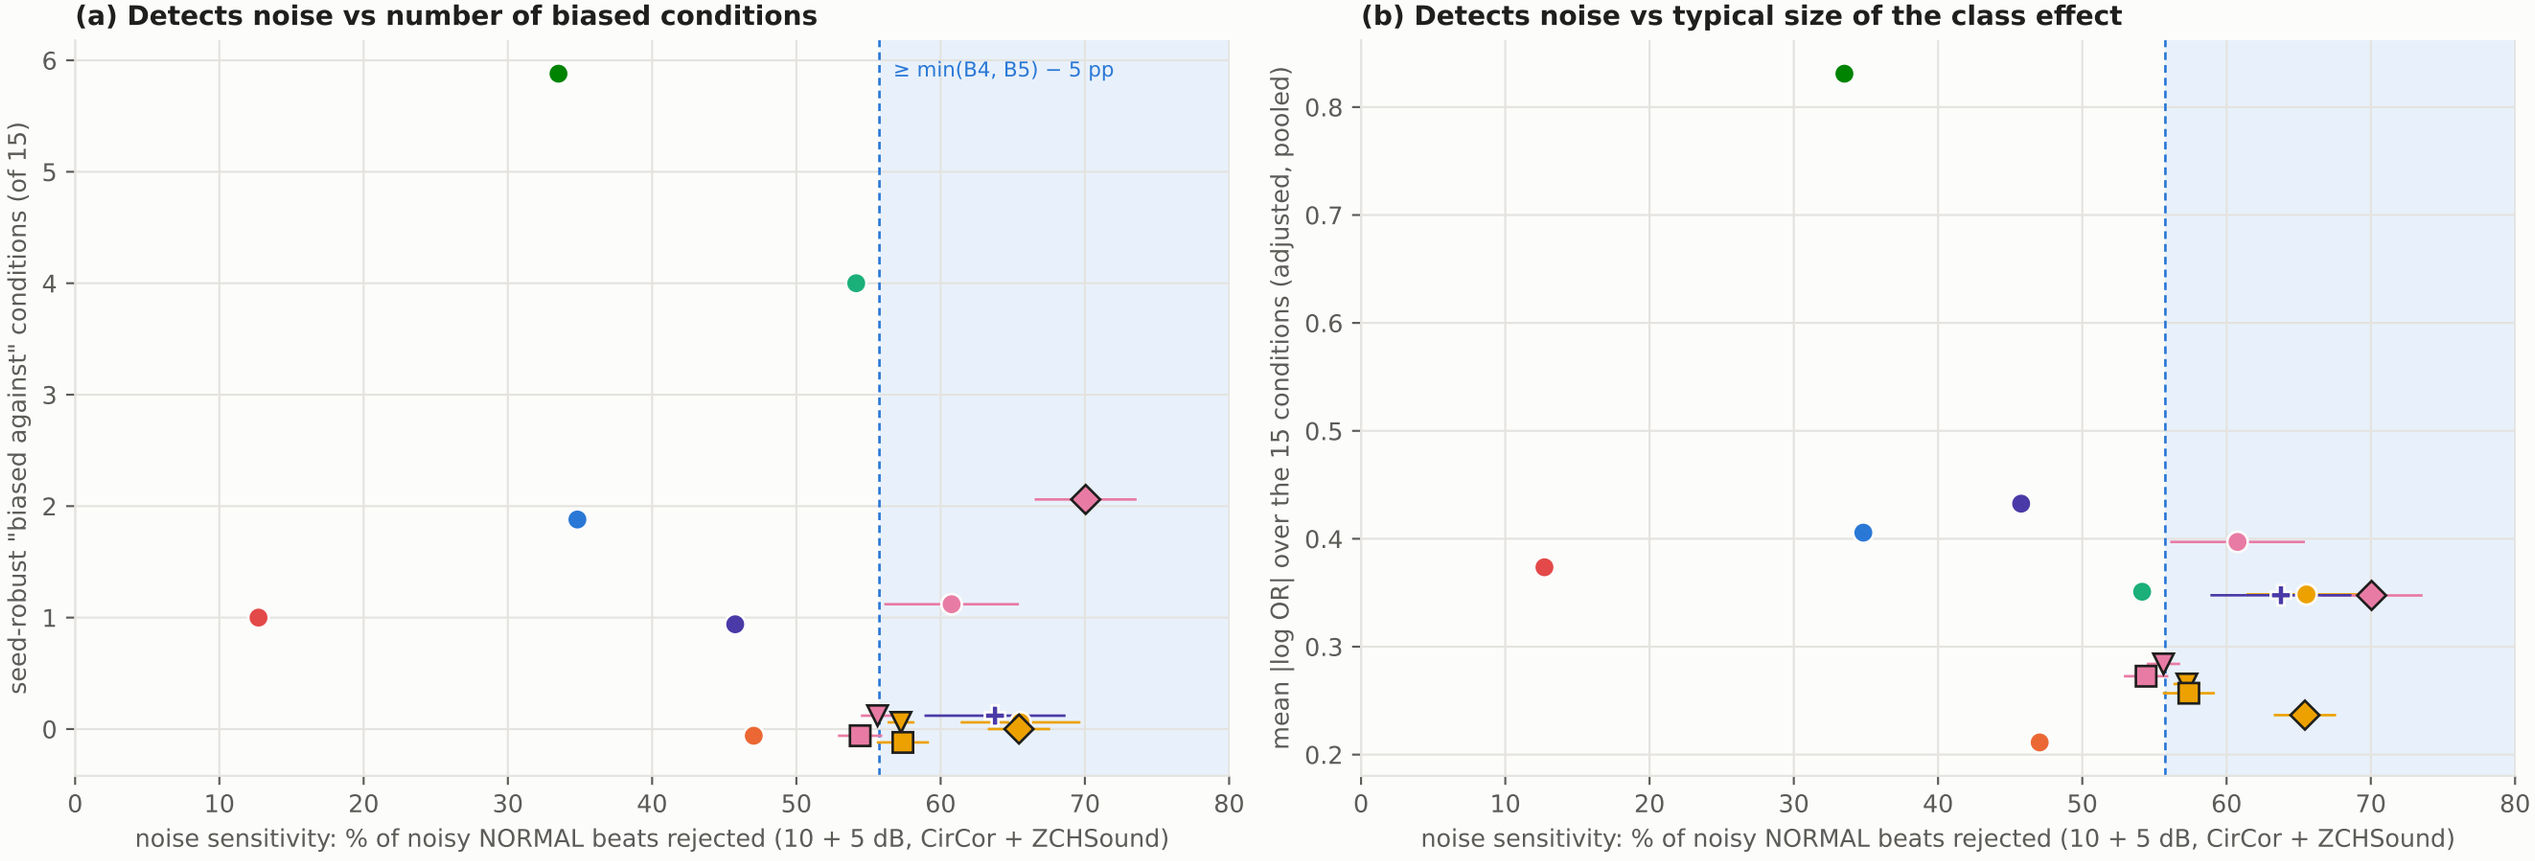
Hybrid hypothesis: can a filter be as noise-sensitive as B4/B5 without their bias? (best = right and low)



E2, matched thresholds. x: mean over seeds (± SD) of the rejection rate of noisy normal evaluation beats. y: seed-robust verdict matrix (fig 12a). Hybrids (black edge) share the colour of their deep model: ▼ AND, ■ CASCADE, ◆ FUSE. Shaded: the pre-specified "close to B4/B5" region (≥ min(B4, B5) − 5 pp). Points in (a) jittered vertically.
